Order from LC or SLA mi\$1.80, ph\$1.80 61-15243

Trans. of Kozhevенно-Obuyynaya Promysliennost'  
(USSR) 1960, no. 3, p. 16-20.

Emulsions of synthetic fatty acids and aluminium alum  
are used to produce insoluble hydrophobic soaps in the  
structure of the leather, thus increasing its resistance  
to water. To raise the wear resistance of the leather,  
small amounts of synthetic or natural tanning agents  
and urea-formaldehyde resin are used. The latter is  
water-soluble and its introduction into the leather  
raises no technological difficulties. Further condensa-  
tion polymerization of the resin occurs during drying  
of the leather.
